

File Naming Convention

Last updated by | Jordan Russell | 16 Oct 2025 at 11:44 BST

Contents

- [General](#)
- [Folder](#)
- [File Name](#)
- [Standards](#)
- [Columns](#)

General

- Ensure the name is unique and does not exist as a reserved keyword.
- Names must begin with a letter and may not end with an underscore.
- **Only use letters, numbers and underscores in names.**
- Avoid the use of multiple consecutive underscores—these can be hard to read.
- Use underscores where you would naturally include a space in the name (first name becomes `first_name`).
- **Avoid abbreviations and if you have to use them make sure they are commonly understood.**

Folder

Folder Naming Structure

<Project>_<Feature>

e.g: Polymers/Market_Rate

Ensure a Folder is created which will be used to house the data of a given project and feature.

e.g:

File Name

File Naming Structure

Folder/Feature/<DatasetName>_<Date>

e.g: Ethanol_2024-01-01

Standards

Please ensure the following are adhered to:

- Written in **CamelCase**

- Names should be less than 126 characters.
 - This includes names for: Columns, Table, File, Sheet
- First word represents the project or feature e.g: Polymers
- **Date** should be in the format **yyyyMMdd** (e.g: 20240701)
- **Never give a table the same name as one of its columns and vice versa.**
- Avoid, where possible, concatenating two table names together to create the name of a relationship table. Rather than `cars_mechanics` prefer `services`.
- A name that begins with the number sign (#) denotes a temporary table or procedure.
- A name with double number signs (##) denotes a global temporary object. Microsoft doesn't recommend using the single number sign or double number sign to begin an object name.
- Underscores "_" will be used to split up different segments of the table name

Old Naming Convention	New Naming Convention
Aluminium Conversion Table	ConversionTable_2024-07-01
July Polymers 2023	PolymersMarketRate_2023-07-01
Ethanol Q1 2024	EthanolMarketRate_2024-01-01
Ethanol Q3 2024	EthanolMarketRate_2024-09-01

Columns

- Written in **snake_case** (may be revised at a later date)
- Always use the singular name.
- Where possible avoid simply using id as the primary identifier for the table.
- For dates, it's good to describe what the date represents. Names like `start_date` and `end_date` are pretty descriptive. If you want, you can describe them even more precise, using names like `call_start_date` and `call_end_date`. Other examples: `first_name` / `last_name` / `duration_seconds` / `data_bytes`.
- The suffix `_key` will be reserved for data modelling
